- $\sum_{k=-a}^a (-1)^k \binom{a+b}{a+k} \binom{b+c}{b+k} \binom{c+a}{c+k} = \frac{(a+b+c)!}{a!b!c!}$

2.2 theorem

Cayley's Formula

There are n^{n-2} spanning trees of a complete graph with n labeled vertices.

Derangement

A permutation of the elements of a set such that none of the elements appear in their original positions. $F(n) = (n-1) * (F(n-1) + F(n-2))$. $F(0) = 1$. $F(1) = 0$.

Euler's Formula for Planar Graph

$V - E + F = 2$, where V = vertices, E = edges, F = faces

Pick's Theorem

$A = i + b/2 - 1$, where A = area, i = internal points, b = border points

Spanning Tree of Complete Bipartite Graph

$N^{M-1} * M^{N-1}$, where N = row and M = column

Pythagorean Triples

Integer solutions of $x^2 + y^2 = z^2$. All relatively prime triples are given by: $x = 2mn, y = m^2 - n^2, z = m^2 + n^2$, where $m > n$, $\gcd(m, n) = 1$, and $m \not\equiv n \pmod{2}$.

Moser's Circle

Determine the number of pieces into which a circle is divided if n points on its circumference are joined by chords with no three internally concurrent. Solution: $g(n) = nC4 + nC2 + 1$

Kirchoff Matrix Theorem

Let matrix $T = [t_{ij}]$, where t_{ij} is the number of multi-edges between i and j , for $i \neq j$, and $t_{ii} = -\deg[i]$. Number of spanning trees of a graph is equal to the determinant of a matrix obtained by deleting any k -th row and column from T .

Euler's Theorem

$a^{\phi(n)} \equiv 1 \pmod{n}$, if $\gcd(a, n) = 1$.

Wilson's Theorem

p is prime iff $(p-1)! \equiv -1 \pmod{p}$.

Pisano Period

Periodicity of fibonacci modulo m .

- $pi(p^k) = p^{k-1} * pi(p)$
- $pi(2) = 3, pi(5) = 20$
- if $p \equiv 1$ or $p \equiv 9$ in modulo 10, $pi(p)$ divides $p-1$
- if $p \equiv 3$ or $p \equiv 7$ in modulo 10, $pi(p)$ divides $2p-1$
- $pi(a * b) = lcm(pi(a), pi(b))$ if $\gcd(a, b) = 1$

Misere Nim

Nim where the winner is the one who can't move. In a nim game with piles (n_1, n_2, \dots, n_k) , **second** player wins iff some $n_i > 1$ and $(n_1 \oplus n_2 \oplus \dots \oplus n_k) = 0$ or all $n_i \leq 1$ and $n_1 \oplus n_2 \oplus \dots \oplus n_k = 1$.

3.11 LineHullIntersection

```
/*
Line-convex polygon intersection. The polygon must be ccw
and have no colinear points. lineHull(line, poly) returns a
pair describing the
intersection of a line with the polygon: (-1, -1) if no
collision, (i, -1) if
touching the corner i, (i, i) if along side (i, i + 1), (i
, j) if crossing sides
(i, i + 1) and (j, j + 1). In the last case, if a corner i
is crossed, this is treated
as happening on side (i, i + 1). The points are returned in
the same order as
the line hits the polygon. extrVertex returns the point of a
hull with the
max projection onto a line.
